

This tab shows a list of symptoms that the patient is showing:

Throughout the conversation this tab is periodically updated with the current most plausible diagnosis in order to show how a diagnosis has progressed over the course of the conversation:

This tab displays the agents responses and available choices for the next response in order to show how the conversation could be carried out and what decisions were made based on user input:

Finally, this tab displays a history of all patients that have interacted with the system for some basic statistics. This information is stored locally in a MongoDB instance with a single collection of conversation documents recording data for each conversation:
